

## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re application of:

Hauptmann *et al.*

Appl. No.: 08/249,671

Filed: May 26, 1994

For: **Process for Preparing and Purifying  
Alpha-Interferon**

Art Unit: 1812

Examiner: Fitzgerald, D.

Atty. Docket: 0652.1350000/RWE/LLK

*considered  
OK 7/10/97***Second Declaration Under 37 C.F.R. § 1.132**Assistant Commissioner for Patents  
Washington, DC 20231

Attn.: BOX AE

Sir:

The undersigned, Rudolf Hauptmann, declares and states that:

1. I am a coinventor of the above-captioned patent application. A copy of my curriculum vitae is attached to the first Declaration under 37 C.F.R. § 1.132 (unsigned) filed November 18, 1996. A signed copy of said first Declaration is filed herewith.

2. I have read and I am familiar with the prosecution of this application, including the Office Action of December 31, 1996, wherein the Examiner rejected claims 1, 3, 17, 19, 25, and 30 as obvious over Miyake *et al.* in view of Chang *et al.*, and further in view of Vandlen *et al.*, Capon *et al.*, and Baxter *et al.*

3. Miyake *et al.* disclose the recovery of IFN expressed from a vector construct comprising IFN- $\alpha$  cDNA ligated to a sequence encoding the alkaline phosphatase (AP) signal

Hauptmann *et al.*  
Appl. No. 08/249,671

sequence (AP/IFN- $\alpha$ ) under the control of an AP promoter (i.e., an AP/AP/IFN- $\alpha$  construct).

According to Miyake *et al.*:

IFN activity of  $1.6 \times 10^4$  units/liter culture was recovered from the lysate of *E. coli* K12 C600 (pTA524) before the osmotic shock procedure and  $7.6 \times 10^3$  units/liter culture from the cold water wash. On the other hand, when *E. coli* K12 C600 (pTA1524) was cultivated, IFN activity of  $3.05 \times 10^4$  units/liter culture was measured from the lysate and  $8.0 \times 10^3$  units/liter culture from the cold water wash.

See Miyake *et al.* at page 1436, column 1, lines 4-12. It is assumed that Miyake *et al.* used 50 OD's of cells for each measurement.

4. The IFN activity was measured by Miyake *et al.* with the CPE inhibition assay using NIH fibroblast interferon standards. See Miyake *et al.*, at page 1431, the paragraph bridging columns 1 and 2. Interferon units are defined internationally. Standards have been established by the National Institute for Biological Standards and Control (NIBSC) and the NIH. Thus, the units described by Miyake *et al.* are comparable to the units obtained as described below.

5. IFN- $\alpha$  that is periplasmically expressed from the AP/STII/IFN- $\alpha$  construct recited in the claims has a biological activity (as measured by the CPE reduction assay) that is identical to the specific activity found for natural human IFN- $\alpha$  ( $2.3 \times 10^9$  units/mg). As described in said first Declaration, when IFN- $\alpha$  was expressed from *E. coli* HB101 containing the AP/STII/IFN- $\alpha$  construct, 5 to 10 mg/50 OD/liter of IFN- $\alpha$  was obtained. Thus, the yield of IFN- $\alpha$  obtained from this construct (5 to 10 mg/50 OD/liter) corresponds to  $1.15$  to  $2.3 \times 10^9$  units/50 OD/liter. This is significantly higher ( $1.5 \times 10^4$  to  $2.9 \times 10^5$  times) than the  $7.6$  to  $8.0 \times 10^3$  units/50 OD/liter culture of the IFN- $\alpha$  obtained by Miyake *et al.* from the periplasmic space (osmotic shock/cold water wash).

Hauptmann *et al.*  
Appl. No. 08/249,671

6. The Examiner is further directed to the publication by Voss *et al.*, a copy of which is attached to said first Declaration as Exhibit C. In particular, Figure 3 on page 721 compares the processing efficiency of different leader sequences for IFN- $\alpha$ 2c expression in *E. coli* W3110. Identification of the protein was done by Western blot. The migration of correctly processed IFN- $\alpha$ 2c is marked with an "m". Figure 3 clearly shows that only the STII leader gives correctly processed product (lane 2) which is between 10 and 20 percent of the total interferon content (see page 722, right column, first full paragraph). Under the same conditions, the AP leader gives no correctly processed IFN- $\alpha$ 2c at all! This finding is well in accordance with the Miyake *et al.* paper which reports a very small recovery ( $10^3$  to  $10^4$  units/OD 50/liter) which was probably not detectable by Western blot.

8. Thus, we have unexpectedly achieved a level of recovery of IFN- $\alpha$  expressed from the claimed construct that is much more than 5 times greater than the recovery of IFN- $\alpha$  from the construct of Miyake *et al.*

9. The data disclosed in Table 1 of Chang *et al.* indicate that the level of expression of hGH from an AP/STII promoter/signal construct (0.5 g/50 OD/L) is five times higher than the level of expression of hGH from an AP/AP promoter/signal construct (0.1 g/50 OD/L). In contrast, we obtained  $1.5 \times 10^4$  to  $2.9 \times 10^4$  times the amount of IFN- $\alpha$  reported by Miyake *et al.* Thus, the results obtained with the construct of the present invention are truly unexpected.

10. I further declare that all statements made of my own knowledge are true and that all statements made on information and belief are believed to be true, and further that these statements were made with the knowledge that willful false statements and the like are punishable by fine or
